

OEI SOFTWARE | VERSION 0.1.3 BETA

What is Entropy Compatible Hiring?

Structured tools for observing operational behavior in hiring and internal contribution mapping.

A separate Windows desktop product

Entropy Compatible Hiring (ECH) uses ten OEI-derived, role-agnostic archetypes and structured interview instruments. It helps teams observe how candidates respond to the operational conditions of their company, and provides a distinct module for exploring potential contributions among existing employees.

Two distinct uses

Candidate hiring

Choose an archetype, add company context, review and approve an applied exercise, then record supporting, contrary, or insufficient behavioral evidence. The report supports role-specific evaluation; it does not make a hiring decision.

Existing Employee Contribution Mapping

Employee reflection and manager observation remain separate. Their comparison highlights convergence, discrepancy, and missing evidence, then suggests an archetype for a bounded work exercise.

What ECH is designed to support

Structured instruments

Ten archetype-specific interview instruments with applied exercises and observation guidance.

Evidence capture

Record what was observed, what was contrary, and what remains insufficient.

Reviewable reports

Keep evidence and its context visible for human interpretation.

Clear assessment boundaries

ECH records operational-behavior evidence relevant to specific OEI archetypes. It does not determine overall candidate quality or replace assessment of skills, experience, technical competence, references, or broader hiring fit. Employee contribution results are exploratory hypotheses, not performance ratings or permanent labels; validate a recommended archetype through a bounded work exercise.

Version 0.1.3 BETA | \$950-\$1,450 USD one-time purchase | No subscription

Beta limitations: session data is not durable and clears when the application closes or a case concludes. AI-assisted exercise generation requires a customer-supplied OpenAI API key. Participant experiences are local pop-out windows, not remotely hosted links.
